

NEW PRODUCT

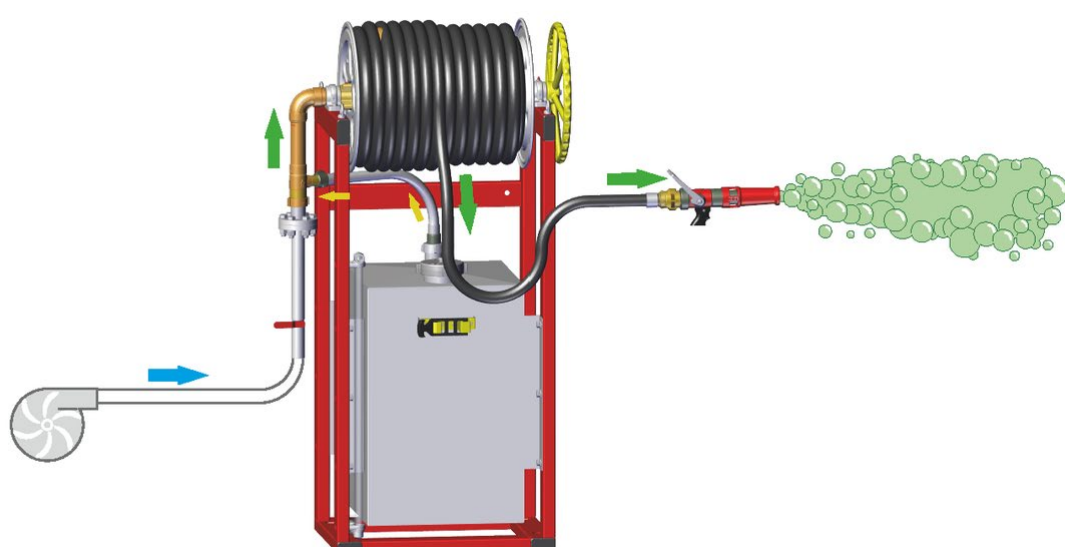

POK is pleased to present its new 200 lpm foam station.

In order to optimize the space used when setting up our foam stations, our R&D department designed a new version combining performance and space-saving.

A REDESIGNED TANK AND FRAME!

The frame of the new foam station is now narrower. Our engineers have managed to reduce the depth of the frame from 615 to 540 mm without reducing the length of the embedded hose.

The shape of the tank has also been revised to fit the new frame perfectly and to keep its capacity of 200 L. It is a rectangular tank (partitioned with breakwaters in order to limit the phenomenon of eddies) which now equips our new foam station.

The new foam station keeps the technical performance of the existing models while offering optimised dimensions for a better integration, for example, on ships.
